

Trans-axillary Silicone Gel Breast Augmentation Before & After

Condition: Decreased volume, minimal upper pole fullness in a patient with well developed musculature

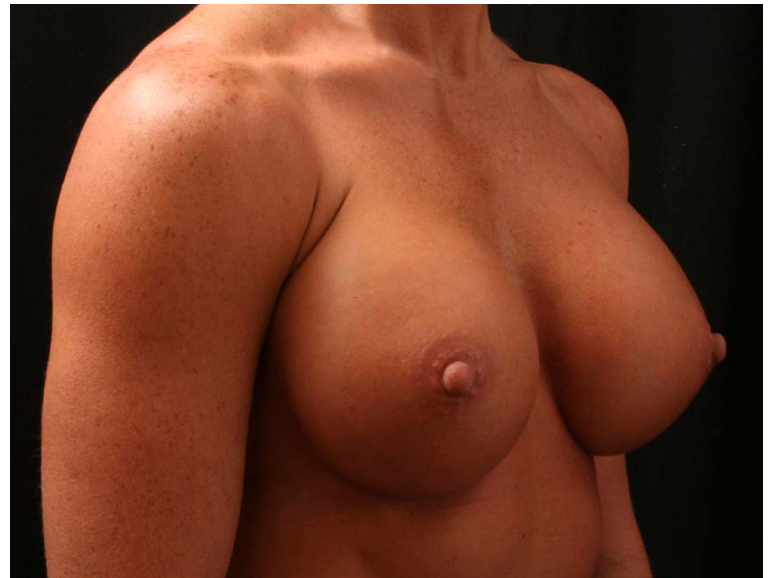

Solution: Trans-axillary (under arm) insertion of a high profile smooth round silicone gel high cohesive implants with concomitant high volume local anesthesia (tumescent)

Benefits:

- No breast scarring
- Minimal operative bleeding
- Fast recovery (able to return to desk job in 2-3 days)
- Pocket placement provides natural look and minimal to NO breast movement or displacement with exercise or flexion of the pectoralis muscle! (This is critical for women with well-developed muscles)

Pre-operative

Post-operative
